

Hello Challenger!

Welcome to break the query! To surpass this challenge, you must write queries to satisfy the given questions. The queries will be based on a Hospital RDBMS schema. A diagram depicting this schema is given below.

1. Hospital Table:

- **Columns:**

- **ID:** A unique identifier for each hospital.
- **Name:** The name of the hospital.
- **Address:** The location or address of the hospital.

- **Explanation:**

- This table stores information about different hospitals. Each hospital has a unique ID, a name, and an address.

2. Doctor Table:

- **Columns:**

- **ID:** A unique identifier for each doctor.
- **Name:** The name of the doctor.

- **HospitalID:** A reference to the hospital where the doctor works.
- **Specialization:** The medical field in which the doctor specializes.
- **Contact_No:** The contact number of the doctor.
- **Explanation:**
 - This table contains details about doctors. Each doctor has a unique ID, a name, and a specialization. The **HospitalID** connects each doctor to a specific hospital.

3. Patient Table:

- **Columns:**
 - **ID:** A unique identifier for each patient.
 - **Name:** The name of the patient.
 - **Address:** The address of the patient.
 - **Contact_No:** The contact number of the patient.
- **Explanation:**
 - This table holds information about patients. Each patient is identified by a unique ID and has a name, address, and contact number.

4. Condition Table:

- **Columns:**
 - **ID:** A unique identifier for each medical condition.
 - **Name:** The name of the medical condition.
 - **Category:** The category to which the medical condition belongs (e.g., General, Chronic, Neurological).
- **Explanation:**
 - This table represents various medical conditions. Each condition has a unique ID, a name, and belongs to a specific category.

5. Appointment Table:

- **Columns:**
 - **ID:** A unique identifier for each appointment.
 - **DoctorID:** A reference to the doctor involved in the appointment.
 - **PatientID:** A reference to the patient involved in the appointment.

- **ConditionID:** A reference to the medical condition for which the appointment is scheduled.
- **Timestamp:** The date and time of the appointment.
- **Fees:** The fees associated with the appointment.
- **Explanation:**
 - This table records appointments between doctors and patients. It includes details such as the doctor, patient, medical condition, appointment timestamp, and associated fees.

6. Pharmacy Table:

- **Columns:**
 - **ID:** A unique identifier for each pharmacy.
 - **Name:** The name of the pharmacy.
 - **Address:** The address of the pharmacy.
- **Explanation:**
 - This table stores information about different pharmacies. Each pharmacy has a unique ID, a name, and an address.

7. Invoice Table:

- **Columns:**
 - **ID:** A unique identifier for each invoice.
 - **PharmacyID:** A reference to the pharmacy where the prescription is fulfilled.
 - **AppointmentID:** A reference to the appointment for which the invoice is generated.
 - **Amount:** The amount charged in the invoice.
- **Explanation:**
 - This table represents invoices generated by pharmacies for appointments. It includes details such as the pharmacy, associated appointment, and the amount charged.
